Job Market Paper

“Geopolitical Shocks, Sovereign Risk, and Asset Prices: Evidence from Mexico”

Abstract. This paper examines how geopolitical pressures shape sovereign default risk and asset prices, exploiting Donald Trump’s rhetoric and actions toward Mexico as a natural experiment. I provide causal evidence that these geopolitical shocks produced sizable and persistent increases in

Mexico's perceived default probability. A textual analysis of President Trump's social-media posts shows that trade-related threats—rather than migration-related comments—were the main drivers of this rise in sovereign risk. A one-basis-point Trump-induced increase in default risk led to a 5.3-cent nominal depreciation of the peso and a 0.11 percent decline in Mexican stock returns, with the tradable and services sectors most affected. At the macro level, the heightened risk perception reduced aggregate consumption by roughly 0.35 percent during 2017–2018, and filtering estimates imply that consumption falls by 0.02 percent within four weeks of a one-basis-point rise in default risk.
